Selector Tracker Fields

- Country Selector
- Group selector
- IP selector
- Page selector
- User selector

User, Group, IP and Page selectors are tracker field types used in the trackers feature to link items to other objects or users. Sometimes these fields are automatically detected, such as a user selector detects the username of ther person creating the tracker item.

Adding a name to a tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with User Tracker, registration tracker or Group tracker

The page Adding fields to a Tracker explains how the fields, (columns or questions) of a tracker are set up.

Display behavior (checked only in tw>=1.10)

In the tracker list panel, the value of these fields will be displayed if the field has the option table visible and hidden/visible is checked for the user.
In the tracker item view panel, the value of these fields will be displayed if the hidden/visible is checked for the user.
In the tracker item edit panel, a tracker administrator (perm tiki_p_admin_trackers) will see each field with the pre-selected right value and will be able to change them. A non administrator will not see them.
