The procedure below should never be needed since the installer manages the data upgrade.

In case anything fails with the automatic upgrade through `tiki-install.php`, you can manually upgrade the database.

If you prefer to do on the command line, you can also use:

```bash
upgrade a Tiki database
php installer/shell.php
```

At the end, you should manually create a file called "lock" inside the `db/` folder where your `local.php` file is stored, in order to secure your installation.
