Minify CSS

Starting in **Tiki19**: Make the filenames of minified CSS files be based on the contents of all the files, not just the filenames, so that when anything changes within a file, i.e. after an upgrade or bug fix, browsers will automatically get the new version of the code (following clearing the tiki caches only). This had already been done for JavaScript in **Tiki18**

New in the **performance** admin panel in **Tiki5**, you can activate to aggregate and compress all CSS files in one. In some tests, this has permitted to generate a huge point increase when testing with **Yahoo! YSlow**
