Plugin Equation

Use this wiki plugin, introduced in Tiki2, to render an equation written in LaTeX syntax as an image. See also MathJax.

Prerequisites

PHP

This plugin must have the php function EXEC enabled on the server for it to work.

LaTex

LaTex distribution must be installed on your server. Check you have installed the following LaTex packages:

- `inputenc`
- `amsmath`
- `amsfonts`
- `amssymb`

- You should have a:
  - `/usr/bin/latex`, `/usr/bin/dvips`, `/usr/bin/convert`, `/usr/bin/identify` and `/usr/bin/convert`
  - If the path of these tasks are incorrect, you must adjust the php code in `lib/equation/class.latexrender.php`
- the directories `lib/equation/tmp/` and `lib/equation/pictures` must be writeable by the server.

The following directories need write permissions for the plugin to work:

- `lib/equation/tmp`
- `lib/equation/pictures`

Parameters

*Introduced in Tiki 2.*

*Preferences required:* `wikiplugin_equation`

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>(body of plugin)</em> - equation</td>
</tr>
</tbody>
</table>

*no parameters*

Examples

Basic syntax
With a famous equation

This code,

$$e=mc^2$$

Would produce on this site:

$$e=mc^2$$

Another equation

This code,

\begin{verbatim}
<math>\setlength{\unitlength}{1cm}
  \begin{picture}(4,2)
    \put(1,1){\circle{3}}
    \put(3,1){\circle*{5}}
  \end{picture}
</math>
\end{verbatim}

Would produce on this site:

\setlength{\unitlength}{1cm} \begin{picture}(4,2) \put(1,1){\circle{3}} \put(3,1){\circle*{5}} \end{picture}

Customizations

This plugin actually wraps a minimalistic LaTex around the formula. For instance, you can customize
lib/equation/class.latexrender.php if you want other fonts.

\documentclass[12pt]{article}
\usepackage[latin1]{inputenc}
\usepackage{amsmath}
\usepackage{amsfonts}
\usepackage{amssymb}
\pagestyle{empty}
\begin{document}
$your sexy formula$
\end{document}
