PluginList with editable fields

PluginList can have a similar behavior to PluginTrackerFilter and PluginCustomSearch using the following:

So adding `editable="y"` to how you would normally use filtering. Ex.:

```plaintext
{filter field="tracker_field_ABC" editable="y"}
```

Benefits

- Better performance than PluginTrackerFilter
- Easier to set up than PluginCustomSearch (no need to set up a tpl if you just need a simple filter)

New in Tiki 20: PluginTrackerList To PluginList Converter supports this.
Ref: https://sourceforge.net/p/tikiwiki/code/71293/

Tiki22

Added Math filter collection:
1. when mirroring a field - added its configuration - so mirroring an ItemLink will most probably add you a dropdown filter
2. when not mirroring a field - added 3 different types of filters - fulltext/initial/exact matches. You can use each of them like this:
   ```plaintext
   {filter field="..." editable="y"} to use fulltext
   {filter field="..." editable="initial"} to use initial match - e.g. matching 123 in 123USD
   {filter field="..." editable="exact"} to use exact match - useful for searching identifiers or things that are not matched via fulltext - stopwords like Y/N yes/no, etc.
   ```

Added range filter to Numeric field. To use it:

```plaintext
{filter field="..." editable="range"}
```
