

Tiki7 will have a much more powerful [Theme Generator](#).

Edit CSS

Edit CSS is a feature to let you create and update the CSS of your theme via the web interface.

Once enabled and saved a button will appear next to the option allowing you to edit the templates css file.

The user must have the tiki_p_create_css permission.

Old doc:

<http://tikiwiki.org/CssEditDev>

This page needs:

- Clarification as to whether this changes theme for all other users or only for user who edits theme, explanation of note 'File with names appended by -(username) are modifiable, others are only duplicable and be used as model.'
- Explanation on which users have tiki_p_create_css permission enabled by default and if it has to be manually enabled for admins and so on.
- Does the old doc have any information worth using here, such as 'To activate it, set the perm in features admin panel; also set the group perms in tiki section.' Does that apply to the updated editCSS feature? If so its an important inclusion in this page.

Warning:

Original CSS files can be overwritten or deleted completely. Backup the file before saving changes. This problem was observed in Tiki9.1 on Debian Squeeze, workaround included here:
