

User, Group, IP selectors are [tracker field types](#) used in the [trackers](#) feature to attribute [items](#) to specific users. Adding a name to a tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with [User Tracker](#), [registration tracker](#) or [Group tracker](#)

The page [Adding fields to a Tracker](#) explains how the fields, (columns or questions) of a tracker are set up.

IP Selector

The automatic feeding option of the field type works exactly like the User Selector except that instead of the user name, it uses the IP of the user.

IP Selector	associates the item field to an IP.
automatic feeding	default textfield
1	assign item to its creator IP
2	assign item to "last modified by" - the field is filled up by the item creator or editor IP.
