Selector Tracker Fields

- Country Selector
- Group selector
- IP selector
- Page selector
- User selector

User, Group, IP and Page selectors are **tracker field types** used in the **trackers** feature to link items to other objects or users. Sometimes these fields are automatically detected, such as a **user selector** detects the username of the person creating the tracker item.

Adding a name to a tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with **User Tracker**, **registration tracker** or **Group tracker**

The page **Adding fields to a Tracker** explains how the fields, (columns or questions) of a tracker are set up.

**Display behavior (checked only in tw>=1.10)**

In the tracker list panel, the value of these fields will be displayed if the field has the option table visible and hidden/visible is checked for the user.

In the tracker item view panel, the value of these fields will be displayed if the hidden/visible is checked for the user.

In the tracker item edit panel, a tracker administrator (perm tiki_p_admin_trackers) will see each field with the pre-selected right value and will be able to change them. A non administrator will not see them.
