

Database Redact

Database redact is an **experimental feature** with the goal to remove certain types of information from a Tiki database. Ex.: [personally identifiable information \(PII\)](#)

Until [Tiki25](#), it is accessible via the Tiki [Console](#)

```
php console.php database:redact
```

Starting in [Tiki26](#), it is accessible via Tiki [Manager](#). This change is made because the feature is basically to

1. make a copy of the data. Ex.: example.org -> redacted.example.org
2. redact it
3. for an admin to verify it

Tiki Manager has all the plumbing for cloning Tiki instances, so it makes more sense.
