

As of 2025-03-30, this page is just a draft.

There are many possible editors. In some cases, it's possible to switch between them.

Editor	Notes
Tiki syntax	Rock-solid textual syntax
HTML WYSIWYG CKEditor4	CKEditor4 is no longer supported . CKEditor is designed for HTML. Until Tiki28
Wiki Inline Editing	Preference name: wysiwyg_inline_editing
Tiki syntax WYSIWYG CKEditor	Less reliable but nice when it works because it maintains Tiki syntax instead of HTML when possible. Preference name: wysiwyg_htmltowiki
Tiki-Flavored Markdown with TOAST UI Editor	Beta quality. The TOAST UI Editor has not seen activity in over 2 years. Offers side-by-side text editor and preview vs WYSIWYG.
HTML WYSIWYG Summernote	Summernote is designed for HTML. Starting in Tiki29
Tiki-Flavored Markdown without TOAST UI Editor	This needs to be added to Tiki

Things to watch out for

- Version history: Some editors will make version comparisons difficult (phantom edits, different output for different browsers, etc.)
- WYSIWYG editors are designed for HTML or Markdown. It's less reliable to add content that goes beyond what editor is designed for like [Wiki Plugins](#)
- HTML WYSIWYG permits for flexibility for page layout
- Tiki syntax (especially with [Wiki Plugins](#)) permits cleaner content and more powerful content reuse.
- [PluginWYSIWYG](#) is a great way to have a WYSIWYG-HTML editor within a wiki page.
