Packages

Also called the Composer Web Installer, and introduced in Tiki18, this feature is for the installation and management of external software packages using Composer.

Overview

Composer is used in the Tiki code development process to import and manage external software such as jQuery and Bootstrap. But some software cannot be packaged with Tiki due to an incompatible license, or shouldn’t necessarily be packaged with Tiki by default because of the software’s specialized nature or niche application. So it is a natural step for Tiki site administrators to be able to use Composer to install and manage external software specifically for their site after the site is installed.

Package list

- Please see: https://packages.tiki.org/
- For developers:
  - Code to build packages
  - Where to modify package availability in the Tiki code

Use

The interface for Packages is located at the site's [tiki-admin.php?page=packages](https://packages.tiki.org/) page. The Packages admin page has four sections, displayed in tabs — Packages Installed, Install Other Packages, Packages Bundled, and Diagnose. These sections are described below:

Packages Installed

This list shows packages that have been installed via this feature. The details for each package include package name, version required, status, and version installed, plus a remove button for each. The version required is the minimum version required by Tiki, so the version installed must be that version or a newer one. If the Packages feature hasn’t been used yet, then of course the list will be empty.

The status column shows a success icon (✔️) if the package is installed, or a warning icon (⚠️) if it is missing. If the package is missing, you can click the "Fix Missing Packages" button that is displayed and Tiki will try to install the package again.

Manual install (FTP)

If for some reason, the web-based package installer is not working for you, you can use the FTP alternative explained at: [https://packages.tiki.org/](https://packages.tiki.org/)
Install Other Packages

This section shows packages that are available to be selected and installed.

Some examples include:

- PhantomJS and CasperJS
- mPDF
- Expose
- SAML

Packages Bundled

This section lists the external software packages that are bundled with the core Tiki files, so are available
for use in a fresh Tiki site. This list is for information purposes only and there's no interface here to make changes.

### Packages Bundled

The "Diagnose Composer" button can be clicked to run Composer and test the output. If Composer isn't found for some reason, there will be a message to that effect.

#### Diagnose Composer Installation

Use the button below to test your composer installation.

### Results

**Composer:** Composer not found

#### Diagnose Composer - Composer Not Found

Normally, Composer will be found and run, and so some information will be shown here.
Diagnose Composer - OK

Troubleshooting

Your requirements could not be resolved to an installable set of packages

If you run into errors such as the following, try uninstalling and re-installing the packages

= Composer execution output:

Errors:
./composer.json has been updated
Loading composer repositories with package information
Updating dependencies
Your requirements could not be resolved to an installable set of packages.

Problem 1
  - Conclusion: don't install mpdf/mpdf v8.0.5
  - Conclusion: don't install mpdf/mpdf v8.0.4
  - Conclusion: don't install mpdf/mpdf v8.0.3
  - Conclusion: don't install mpdf/mpdf v8.0.2
  - Conclusion: don't install mpdf/mpdf v8.0.1
  - Conclusion: don't install mpdf/mpdf v8.0.0
  - Conclusion: don't install mpdf/mpdf v8.0.4
  - Conclusion: don't install mpdf/mpdf v8.0.3
  - Conclusion: don't install mpdf/mpdf v8.0.2
  - Conclusion: don't install mpdf/mpdf v8.0.1
  - Conclusion: remove setasign/fpdi 1.6.2
  - Installation request for mpdf/mpdf ^8.0.0 -> satisfiable by mpdf/mpdf[v8.0.0, v8.0.1, v8.0.2, v8.0.3, v8.0.4, v8.0.5].
    - Conclusion: don't install setasign/fpdi 1.6.2
    - mpdf/mpdf v8.0.0 requires setasign/fpdi ^2.1 -> satisfiable by setasign/fpdi[v2.1.0, v2.2.0, v2.3.0, v2.1.1].
      - Can only install one of: setasign/fpdi[v2.1.0, 1.6.2].
      - Can only install one of: setasign/fpdi[v2.2.0, 1.6.2].
      - Can only install one of: setasign/fpdi[v2.3.0, 1.6.2].
      - Can only install one of: setasign/fpdi[1.6.2, v2.1.0].
- Can only install one of: setasign/fpdi[1.6.2, v2.2.0].
- Can only install one of: setasign/fpdi[1.6.2, v2.3.0].
- Installation request for setasign/fpdi (locked at 1.6.2) -> satisfiable by setasign/fpdi[1.6.2].

Running update with --no-dev does not mean require-dev is ignored, it just means the packages will not be installed. If dev requirements are blocking the update you have to resolve those problems.

Installation failed, reverting ./composer.json to its original content.

Future development
Initially, the focus will be files at https://packagist.org/, but later this feature is intended to be expanded to include importing themes, libraries formerly hosted at mods.tiki.org, language files, and more.
