

Plugin A Name

This [wiki plugin](#), available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the [PluginAlink](#), which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the [PluginAlink](#) to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

Parameters

Create an anchor that can be linked to

Introduced in Tiki 1.

[Go to the source code](#)

Preferences required: wikiplugin_aname

Parameters
<i>(body of plugin)</i> - The name of the anchor.
<i>no parameters</i>

Usage

To take use this plugin in a wiki page, use the syntax:

```
{ANAME()}anchorname{ANAME}
```

In the generated XHTML for your webpage, Tiki will create the following anchor:

```
<a id='anchorname'></a>
```

Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores (_).
For example, `{ANAME()}my custom anchor{ANAME}` will render as: ``.
- Starting with Tiki release 2, Tiki generates the anchor using the `id` attribute. In prior releases, Tiki used the HTML name attribute (``).

Example

Aname Plugin Usage

```
{ANAME() }
```

anchorname *<--put the name of the anchor here. Use this same name for the aname= parameter in the Plugin Alink (see just below).*

```
{ANAME}
```

ANAME example: `{ANAME()}anchorname{ANAME}`

Alink Plugin Usage

```
{ALINK(
```

aname=anchorname <-- put here the name of the anchor you created using the Plugin Aname!

}}

link text <-- put here the text to appear as the link.

{ALINK}

ALINK example: {ALINK(aname=anchorname)}link text{ALINK}

or rather, I only work so

ALINK example: -+{ALINK(aname="anchorname" pagename="wiki pagename")}]link text{ALINK}+

Demonstration

To jump down to the anchor at the bottom of the page click [HERE](#). <-- Here is where I put the ALINK plugin in this page.

.

.

.

.

.

.

.

Here is a second [link](#) to the same anchor at the bottom of the page. Again, I used the ALINK plugin.

.

.

.

.

.

The anchor is here. <-- I put the ANAME plugin at the beginning of this line. Now you can click [HERE](#) to jump to the anchor I put at the top of the page (you can't see where that one is unless you look into the page editor ☐)
