Plugin Indentation

Introduced in Tiki24

Use this wiki plugin to indent a block of wiki content at the paragraph level (such as paragraphs, tables, code blocks...) by one level. Use properly nested `{INDENT}...{INDENT}` calls for further indentation.

Parameters

There are no parameters required - only the text between the `INDENT` tags is needed.

Examples

Example 1

This code:

```
Before
{INDENT}Between{INDENT}
Afters
```

Would produce on this site:

Before

  Between

Afters

Example 2

Use this code to indent two levels:

```
Before
{INDENT}Level 1
  {INDENT}Level 2{INDENT}
```
This produces:

Level 1

Level 2

Example 3

Do not use this code to indent two levels:

Before

{INDENT()}Level 1{INDENT}
{INDENT()}{INDENT()}Level 2{INDENT}{INDENT}

Afters

This is because the browser generates a vertical gap when repeating the indentation several times, like above. The gap gets bigger with each level of indentation. This is what the browser produces when doing it like in example 3:

Before

Level 1

Level 2

Afters
