A collection of (so far one) tips, hacks and fun things you can do with PluginList that don’t really belong anywhere else.

## Set the Browser Page Title

A client needed a wiki page title (set in the `<head><title>` tag) changed from the default page name, and (eventually) we did it like this:

```plaintext
{DIV(class=d-none)}{LIST()}
{pagination max=1}
{OUTPUT} {display name=mytitle pagetitle=y} {OUTPUT}
{FORMAT(name=mytitle)}This is the page title, not the wiki page title{FORMAT}
{LIST}{DIV}
```

...add your tips here!
