PluginList Aggregate control block

Starting with Tiki18, search results returned by LIST plugin can be aggregated and some fields optionally summed. Accepted arguments:

- fields: comma-separated list of field names to aggregate the results from. The values of these fields will determine the key by which results will be aggregated.
- totals: comma-separated list of field names to sum and display aggregated amount. These fields need to be numeric type fields.

Note

This is not connected with Elasticsearch's aggregations framework. In Tiki these are still referred to as `facets` which dates from the ES v1 facets module. These can currently (Tiki 19) be used only in PluginCustomSearch.

All the LIST Plugin control blocks

- PluginList pagination or list control block
- PluginList filter control block
- PluginList output control block
- PluginList format control block
- PluginList display control block
- PluginList sort control block
- PluginList advanced output control block
