

# Plugin Transclude

Introduced with *Tiki6*

This [wiki plugin](#) includes the content of a wiki page and replaces values in the body of the included page. It is similar to the mediawiki feature [transclusion](#).

## Parameters

Include the content of another page with certain changes

Introduced in *Tiki 6*. Required parameters are in **bold**.

[Go to the source code](#)

Preferences required: `wikiplugin_transclude`, `feature_wiki`

Parameters	Accepted Values	Description	Default	Since
<b>page</b>	pagename	Name of the wiki page to use as a template for the values.		6.0

## Usage

When the TRANSCLUDE plugin, placed in Page A, fetches the wiki page B, the tag `%%text%%` on Page B is replaced by whatever is inside the TRANSCLUDE tag on Page A.

Furthermore, any other parameters (if they exist in Page B ) will be replaced by their values given in the Transclude plugin on Page A..

## Examples

```
{TRANSCLUDE(page="pageName" key="value" key="value" ...)}text{TRANSCLUDE}
```

For instance, say we have a todo box page with template like this:

```
{BOX(class="todo_box", float="right", title="__Todo__ on this page:")} %%%text%%%{BOX}
```

It will render like this:

**Todo** on this page:

text

Now, let's use that template page to '*transclude*' some todo items on a page:

```
{TRANSCLUDE(page="todoBox")} * Bring out the garbage * Feed the goldfish {TRANSCLUDE}
```

All additional parameters will be replaced. For example `%%title%%` will be replaced with the parameter title in the plugin.

```
{TRANSCLUDE(page="todoBox" title="ToDo")} * Bring out the garbage * Feed the goldfish {TRANSCLUDE}
```

## Issues

%%title%% syntax conflicts with the %% syntax for rendering a line break <br>
