

Pretty Tracker HowTo

A "Pretty Tracker" is a prettier way to list (or input) your [Tracker](#) data.

To create a "Pretty Tracker" in Tiki you need:

- One [Tracker](#) with at least one field
- One [Wiki](#) page with [PluginTrackerlist](#) (to list the data) or define a template directly in the Tracker (or a Wiki page with [PluginTracker](#) to input the data to a Tracker using a pretty formatted form)
- One template which tells how the data (or input fields) should be formatted (can be a Wiki page or *.tpl file)

Here's step by step guide (using the TrackerList wikiplugin and a Wiki page as a template):

1. **Create a Tracker** and note the Tracker ID and then **create some field(s)** for it and note the Field(s) ID(s) (name the Tracker for example "**Fruit**" and the created field(s) can be "**Fruit Name**" of type text input, etc.)
2. **Insert some new Tracker Items there** after creating the Tracker, e.g. three items: Apple, Pear and Orange
3. **Create a Wiki page** named "fruit_template" with at least one `{f_X}`, for example:

```
__{$f_1}__ ---
```

(Assuming the "Fruit Name" field has ID 1)

4. **Set the permissions** for that template page to *tiki_p_use_as_template* and remove *tiki_p_edit* and *tiki_p_view* for Anonymous so your visitors cannot edit and view the template page
5. **Create another Wiki page** "Fruit List" with

```
List of my Fruit: {trackerlist trackerId=1 wiki=fruit_template}
```

(Assuming the "Fruit" Tracker has ID 1)

As a result you should now see the three fruits listed in bold on the page "Fruit List" one under each other and divided by horizontal line according to the template:

List of my Fruit:

Apple

Pear

Orange

That's it ! ☐

For more details see [Pretty Tracker](#) page.
