Users Shade Modules

(Introduced in: Tiki 1.9)

This option on the Admin->Features panel controls whether modules can be shaded or not. When a module is shadeable, clicking on the show/hide module contents icon in the module's title bar, or double-clicking the module's title bar, will flip between only displaying the title and displaying title plus the module contents, for that user.

Settings

There are three settings:

- Always - all modules in columns are presented with the shade button
- Module decides. This is the default
- Never - no modules in columns are presented with the shade button

Module decides

By default, the application menu is shadeable, other menus and modules are not. Administrators can turn on the shade button - on a module-by-module basis - by putting 'flip=y' into the parameters box on the Admin->Modules panel.

MODULE plugin

By default a module called via the MODULE plugin follows the same rules than the column modules. But if a user specify the module param flip with a value y or n, this behavior overwrites the default one.
