

Google Web Fonts

It's quite easy to use [Google Fonts](#) in Tiki!

See also: [PluginFont](#)

How to configure

The screenshot shows the Tiki Theme Generator interface. At the top, there are tabs for 'Theme', 'General Layout', 'Shadow layer', 'Pagination', 'UI Effects', and 'Customization'. The 'Customization' tab is selected. Below the tabs, there is a section titled 'Theme Generator (Experimental)' with a checkbox labeled 'Theme Generator' and two status icons: a blue question mark and a yellow warning triangle. Underneath this is a 'Custom Codes' section with a 'Custom CSS:' input field containing the CSS rule `html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }`. There is also a 'Change Highlighter' button. Below the CSS is a note about an experimental CSS assistant. The final section shows 'Custom HTML <head> Content' with the `<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>` tag.

To affect most of the text

```
html > body, *:first-child + html body
```
