

User, Group, IP selectors are [tracker field types](#) used in the [trackers](#) feature to attribute [items](#) to specific users. Adding a name to a tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with [User Tracker](#), [registration tracker](#) or [Group tracker](#)

The page [Adding fields to a Tracker](#) explains how the fields, (columns or questions) of a tracker are set up.

## IP Selector

The automatic feeding option of the field type works exactly like the User Selector except that instead of the user name, it uses the IP of the user.

<b>IP Selector</b>	associates the item field to an IP.
automatic feeding	default textfield
1	assign item to its creator IP
2	assign item to "last modified by" - the field is filled up by the item creator or editor IP.
