

Mail Queue

Since [Tiki10](#) there is a feature to place all notification email messages in a queue, and send all those emails periodically through a [Cron](#) job using `./console.php` script with `mail-queue:send` parameter. See also [Console](#)

(N.B. Historical note: Prior to Tiki 12.2 the command was `./sendmail.php`)

This requires setting up mail delivery with a SMTP server instead of just sendmail, and set it to use a Queue.

-

Settings

See **Admin home > General > General Preferences > Mail**

In some servers (email accounts set up with [ISPConfig](#) standard options), this is known to work with:

- Authentication **PLAIN**
- Security: **TLS**
- Port: **587**
- Local server name: **server.example.com**
(i.e., the real Fully Qualified Domain Name of the server, which is not the same as the mailname, which could be `example.com` or `mail.example.com`, or the smtp server, which usually is `smtp.example.com`).

Mail

Default charset for sending mail: utf-8 ⓘ

Mail end of line: LF (some Unix MTA) ⓘ

Mail Sender: SMTP ⓘ

SMTP Server: smtp.example.com

Authentication: LOGIN ⓘ

These values will be stored in plain text in the database:

Username: foo

Password: ...

Port: 25

Security: TLS

Local server name: localhost ⓘ

Mail Delivery: Queue ⓘ

Email to send a test mail

Email footer: ⓘ

Click to expand

Temporary storage

The messages temporarily sent to the smtp queue are stored in tiki database table **tiki_mail_queue**, which has these 3 fields:

- messageId
- message
- attempts

Cron

Example of cron job in a linux box, for site1.example.com on a [Multitiki](#) instance at directory **/var/www/tiki**, that will send emails from the queue every 5 minutes starting at minute 2 of each hour (see [Console](#) and [Cron](#) for more details):

```
2,7,12,17,22,27,32,37,42,47,52,57 * * * * cd /var/www/tiki/;php console.php mail-queue:send --site=site1.example.com > /dev/null 2>&1
```
