The procedure below should never be needed since the installer manages the data upgrade.

In case anything fails with the automatic upgrade through  ${\bf tiki\text{-}install.php}$ , you can manually upgrade the database.

If you prefer to do on the command line, you can also use:

upgrade a Tiki database

php installer/shell.php

At the end, you should manually create a file called "lock" inside the db/ folder where your local.php file is stored, in order to secure your installation.
