

About Tiki Packages in Tiki 18.0 LTS and why I support this project. And mods.tiki.org can now be scheduled for retirement (Marc Laporte).

Mods

The **Mods** feature was introduced in Tiki 1.9 as a tool to distribute, install, upgrade and remove Tiki components with LGPL incompatible licenses which didn't allow them to be included as part of the Tiki release package. A Mod can be a feature, plugin, module, theme, language file, replacement for an existing feature, or a combination of these. However, this feature is now **deprecated** in favor of [Packages](#) and, as of **Tiki 19**, it is completely **obsolete**, as all mods-related code has been removed in this version. Towards the end of life of the Mods feature, it has been used only for aftermarket visual themes and [PluginR](#).

The screenshot shows a web browser window with the URL <http://mods.tikiwiki.org/>. The page title is "TikiWiki Mods Repository". A legend indicates the color coding for mod freshness: Red (recent < 1 week), Orange (fresh < 1 month), Green (current < 3 months), Blue (old > 3 months), and Grey (archive > 1 year). The main content is a table listing mods, grouped into "avatars" and "features".

Type	D1 Name	LastUpdate	Version	Licence	Description
avatars	dragonballz	2004.09.29	1.3	unkown	Collection of 31 avatars from the Dragon Ball Z (tm) serie.
	gnumes	2004.11.01	1.2	Free Images	Collection of 16 avatars from the Gnumes collection
	goldorak	2004.09.29	1.3	unknown	Collection of 19 avatars from Goldorak (tm) serie.
	mcdonald	2004.09.29	1.3	unknown	Collection of 19 avatars from McDonald (tm).
	xmen	2004.09.29	1.3	unknown	Collection of 46 avatars from the Xmen (tm) serie.
	all		2007.03.15	1.1	unknown
features	cc	2005.04.13	1.3.10	GNU/LGPL	Multi-currencies management system
	config	2005.09.28	1.1	Public Domain (no license)	A work-in-progress Config menu
	import-phpwiki	2004.10.29	1.1	GNU/LGPL	Import content from PHP Wiki

Basic principle

The Tiki Mods behaves like many package management software that is known in the unix world, and could be compared to the debian apt, the redhat yum; mandrake urpmi; or gentoo emerge, but adapted to the tikiwiki environment. It's a web-based tool for update operations on some tikiwiki extensions. It fulfills the following functions:

- listing of a remote mods server, by default <http://mods.tiki.org/>
- maintenance of locally stored mods : comparison with remote, downloading of new versions
- installation of local mods, upgrade and removal

The admin mods interface can be found in **tiki-mods.php**, provided that you log in as admin.

More information

See [Mods User](#) for more information on how to install mods easily through the **tiki-mods.php** admin interface, and [Mods Admin](#) if you need manual install of mods, and further customizations.
