

Module menu

Starting in [Tiki7](#), there is a dedicated menu module.
You can use it in a wiki page with this syntax:

```
{module module="menu" structureId=1}
```

where structureId is the ID of the structure. You can find the id of the node (or subnode) of the structure that you want to start the menu with, when you visit the page to edit a structure. Each page of the structure has a page_ref_id number associated with it. This is the ID that you can place in the param structureId of the module.

Before the existence of the Module menu, you had to create the menu this other way, instead, in a custom module:

```
{menu id=43 css=y type=horiz toLevel=0}
```

Example based on Structure (sub)tree

Imagine that we have this structure defined in our Tiki:

```
Introduction
Methodology
  Design of Experiment
  Wet Lab work
  Data processing work
  Statistics work
Results
Discussion
Bibliography
```

Those pages, once created the structure, will receive an Id number (page_ref_id param).

The screenshot shows a web browser window with the address bar containing '12.x/tiki-edit_structure.php?page_ref_id=6'. The page title is 'Modify Structure: My Paper'. Below the title is a 'Structures' button. The main heading is 'Structure Layout', with a red box labeled 'page_ref_id' pointing to it. Below this is a list of structure items, each with a red number on the left and a light blue row on the right. The items are:

- 6 Top (with an 'Update' button)
- 7 1. Introduction
- 8 2. Methodology (expanded to show sub-items)
- 9 1. Design of Experiment
- 10 2. Wet Lab work
- 11 3. Data processing work
- 12 4. Statistics work
- 13 3. Results
- 14 4. Discussion
- 15 5. Bibliography

 Each row has a 'Page alias...' field and a set of icons (magnifying glass, left arrow, right arrow, plus, minus, refresh, and close).

Click to expand

The homepage of the structure has page_ref_id=6. If we added that number to the module menu Structure Id param, the full structure tree would be used for the menu. If we use another page_ref_id, from a subtree of the structure (like page_ref_id=8, for the subsections of "Methodology"), then that subtree would be used to create the menu.

Assigned modules Edit module Custom Modules All Modules

Edit this assigned module: menu

Preview

- Design of Experiment
- Wet Lab work
- Data processing work
- Statistics work

Module Name ▼
Displays a menu or a structure as a menu.

Basic **Module** Appearance Visibility

Menu

Identifier of a menu (from tiki-admin_menus.php)

Structure

Identifier of a structure of wiki pages (name or number from tiki-admin_structures.php)

Type

Direction for menu: horiz or vert (default vert)

Click to expand

Once saved, the menu would display its links dynamically:

Methodology

- Design of Experiment
- Wet Lab work
- Data processing work
- Statistics work

Note: Links and buttons in modules, apart from the Application Menu, have been deliberately disabled on this page to make drag and drop more reliable. Click here to return HOME
[More info here](#)

Assigned modules Custom Modules All Modules No Tabs

Assigned Modules

Add module

Top Topbar Pagetop Left Right Pagebottom No Tabs

Bottom

Name	Order	Cache	Rows	Parameters	Groups	Action
menu	1	7200		id=42 flip=y	Registered	
menu	2	0	10	structureId=8 type=vert title=Methodology nobox=n notitle=n	Registered	

Click to expand

If we add new pages to that structure subtree, they would show up automatically as links in the menu also.

Making menus look good

For top-right horizontal menu

1. Use the module menu in the "top" section with the following parameters:
 - id= (put the ID of the menu you want there)
 - type=horiz
 - css=y
 - menu_id=secondary_site_menu
 - menu_class=box-secondary_site_menu
 - nobox=y

The second-level horizontal menu

1. Use the module menu in the "topbar" section with the following parameters:
 - id= (put the ID of the menu you want there)
 - type=horiz
 - css=y
 - menu_id=tiki-top
 - menu_class=clearfix
 - nobox=y

Using CSS option (instead of bootstrap) so the sub-level menu open where there is room.

If you use a CSS menu instead of the default bootstrap in the footer (for example, a horizontal one there when there's no left column on the page), then the dropdowns will slide upward to stay in view.

1. Sample using a module menu in the "bottom" section with thre following parameters:
 - id= (put the ID of the menu you want there)
 - type=horiz
 - bootstrap=n
 - css=y

Bottom menu sub-level that dropup (slide up) and instead of dropdown (slide down)

On admin-modules, under the menu or for other dropdown-containing module's you can go to "Appearance" tab, add "dropup" for the "custom class" option.

Comparison with other modules

What is better with the "module menu" compared to the "module wikistrukturemenu", is that the "module menu" you can use for horizontal and vertical menus, whilst the "module wikistrukturemenu" works only vertically.

Example

See:

<http://projekte.go-man.eu/Dokumentationen>

The main horizontal navigation menu in the top bar, that you can see aswell on the one column HomePage, is a "module menu" with a "standardly assigned menuId".

Each of the topnavigation items link to a wikistrukture startpage, each assigned to an appropriate category.

There is a second horizontal menu - not in the topbar, but in the pagetop.

This is the same menu than lefthandside, so it is a wikistrukturemenu - but this one is made with the "module menu" (instead of the lefthand ones, which are said to be "modules wikistrukturemenu").

So you see that a wikistrukture menu works with the "module menu" aswell.

If the menu should be restructured - mostlikely the new pages autoposition in the menu does not fit exactly - somebody with permission to admin the structure has to move up and to deprecate or to promote the page in the structure - that is done only with arrows up/down/left/right

In the admin area of the specific structure, you also can add (or delete) pages to this structure and depending of the settings regarding autocategorisation, these added pages also appear in the menu automagically (if a structured page would not be in the structures category, the menu would disappear).

This way, you do not need to give any editor the task and/or permission to edit menus.

The moving of pages in the structure is such time-un-consuming, that a few people with permissions on structure administration might be enough and this might not necessarily a permission for all editors.
