To handle multilingual menus, there are several options.

**Module displayed only for a language**
Add a menu to a module and filter module by language

- **Multilingual Module**

**Use language files to translate labels**
You can use the standard string translation process

- set your menu option name in `admin-> menu` in English
- set the user module title in the `admin -> modules panel` in English
- add in `lang/your_language/language.php`, the list on translations

But the URLs will not be translated. English should be the reference language, the same way it is the Smarty templates.

**Check language and show alternate menu**
The best way to do this is using the **Module menu** and set the Language parameter in **Module Settings Parameters** to display the menu when you select a language for the current session. You will need one menu for each language on your website.

Alternatively you can add the following script in **Site Identity**:

```
{if $prefs.language eq "en"} {menu id=43 css=y type=horiz} {else} {menu id=1 css=y type=horiz} {/if}
```
