

Plugin Countup

Introduced in [Tiki25](#), use this plugin to make a counter on a wiki page. You can add one or multiple counters on the same page and each counter starts to count when it becomes visible in the viewport. Each counter has its own custom settings (Title, ending number, custom counting (animation) speed, custom CSS (color, font size, font family, background, ...), etc.).

See also [PluginCountdown](#)

1. Parameters

Introduced in Tiki 25.0. Required parameters are in **bold**.

[Go to the source code](#)

Preferences required: `wikiplugin_countup`

Parameters	Accepted values	Description	Default	Since
title	string	Counter title		25.0
titleFontFamily	string	Counter title font family		25.0
titleFontWeight	text	Counter title font weight	normal	25.0
titleFontStyle	text	Counter title font style	normal	25.0
titleFontSize	float	Counter title font size in pixels. For instance, use 16 for 16 pixels	32	25.0
titleFontColor	alpha	Counter title font color. For instance, use blue for blue color. You can also use the hexadecimal rgb code or the rgba syntax to specify the color	black	25.0
icon	int	Numeric ID of an icon in a file gallery. This will be set as 0 the counter icon	0	25.0
iconWidth	int	Icon width size	64	25.0
iconHeight	int	Icon height size	64	25.0
description	string	Short description of the counter		25.0
descriptionFontFamily	string	Counter description font family		25.0
descriptionFontWeight	text	Counter description font weight	normal	25.0
descriptionFontStyle	text	Counter description font style	normal	25.0
descriptionFontSize	float	Description font size in pixels. For instance use 16 fir 16 pixels	12	25.0
descriptionFontColor	alpha	Decription font color	black	25.0
startingNumber	int	The number from which the counter will start to count	0	25.0
endingNumber	int	The number to which the counter will stop to count		25.0
numberFontFamily	string	This is the font family of the displayed number in the counter at a certain time		25.0
numberFontWeight	text	Displayed number font weight	normal	25.0

<code>numberFontSize</code>	float	This is the size of the displayed number in pixels. For instance , use <code>16</code> for 16 pixels	32	25.0
<code>numberFontColor</code>	alpha	Dispalyed number font color. For instance, use <code>blue</code> for black blue color. You can also use the <code>hexadecimal rgb</code> code or the <code>rgba</code> syntax to specify the color	black	25.0
<code>speed</code>	float	The counting(animation) speed of the counter in seconds	0.2	25.0
<code>delay</code>	float	The delay time in seconds after which the counter will start to count when it becomes visible in the viewport	1.0	25.0
<code>prefix</code>	text	Letter, number or symbol to use as prefix of the number counter		25.0
<code>suffix</code>	text	Letter, number or symbol to use as suffix of the number counter		25.0
<code>width</code>	int	Counter width in pixels. For instance, use <code>200</code> for 200 pixels	400	25.0
<code>height</code>	int	Counter height in pixels. For instance, use <code>200</code> for 200 pixels	300	25.0
<code>backgroundImage</code>	int	Numeric ID of an icon in a file gallery. This will be set as the counter background image	0	25.0
<code>backgroundColor</code>	alpha	Counter background color. You can use the color name, the <code>hexadecimal rgb</code> code or the <code>rgba</code> syntax to specify the color.		25.0
<code>shadow</code>	string	This property adds shadows to the counter via a comma separated list of shadows. A shadow is defined with horizontal and vertical offsets from the element (in our case, the counter), with blur and spread radius and with a color. For instance, use <code>inset 2000px 0px 0px 0px #24a2c09c</code> for 2000px horizontal offset, 0px vertical offset, 0px blur radius, 0px spread radius and with a light blue color. The inset keyword reverses the shadow inside. For the color value, you can use the color name, the hexadecimal rgb code or the rgba syntax. For more details See here . Please be sure to respect the syntax given in the documentation to see the effect.		25.0

2. Examples of use

Example 1 :

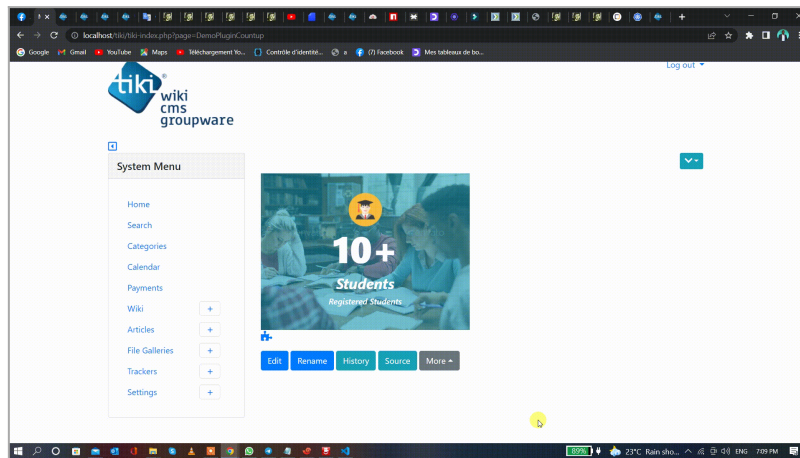

In this example, we have one counter on the page and we are counting the number of registered students with a counting speed of 1 second.

The following code:

```
{countup title="Students" titleFontWeight="bold" titleFontStyle="italic"
```

```
titleFontColor="white" icon="61" description="Registered Students"
descriptionFontStyle="italic" descriptionFontColor="white" endingNumber="10"
numberFontWeight="800" numberFontSize="70" numberFontColor="white" speed="1" delay="1"
suffix="+" backgroundImage="62" shadow="inset 2000px 0px 0px 0px #24a2c09c"}
```

Produces this:

Example 2 :

In this example we have two counters on the same page and each counter has its own custom settings (counting speed, font style, font color, etc) and starts to count when it becomes visible in the viewport.

The following code:

```
!~#09F:Plugin Countup~~
{countup title="Students" titleFontWeight="bold" titleFontStyle="italic"
titleFontColor="white" icon="61" description="Registered Students"
descriptionFontStyle="italic" descriptionFontColor="white" endingNumber="15"
numberFontWeight="800" numberFontSize="70" numberFontColor="white" speed="1" delay="1"
suffix="+" backgroundImage="62" shadow="inset 2000px 0px 0px 0px #24a2c09c"}
{countup title="Countries" titleFontWeight="bold" titleFontColor="white" icon="60"
endingNumber="195" numberFontWeight="bold" numberFontSize="70" numberFontColor="white"
speed="0.02" shadow="inset 2000px 0px 0px 0px #24a2c09c"}
```

Note:

This plugin will be available for use when [Tiki 25.0](#) will be released in October 2022. Since the plugin is already included in Tiki 25, anyone who has this version today can use the PluginCountup immediately.
