

Not to be confused with [PluginSign](#)

<https://sourceforge.net/p/tikiwiki/code/77409>

It uses https://github.com/szimek/signature_pad

We have pushed a new `wikiplugin_signature`, which allows to draw a signature and save it as an image.

How to use:

```
{CODE()}  
{signature}  
{CODE}
```

Additional params:

- * name - Like the "person" who should sign (example: customer). The name is displayed in the signature button.
- * width - The signature image width (default is 400px).
- * height - The signature image height (default is 200px)
- * align - Where to position the signature (default is left).

After save, the image is stored within the plugin content as `image/png base64`.

The plugin is also ready for PDF export since it uses images after signature is saved.

Caveats: Who signs needs permission to edit the tiki-page.
