

Plugin Transclude

Introduced with [Tiki6](#)

This [wiki plugin](#) includes the content of a wiki page and replaces values in the body of the included page. It is similar to the mediawiki feature [transclusion](#).

Parameters

Introduced in Tiki 6. Required parameters are in **bold**.

[Go to the source code](#)

Preferences required: `wikiplugin_transclude`, `feature_wiki`

Parameters	Accepted Values	Description	Default	Since
page	pagename	Name of the wiki page to use as a template for the values.		6.0

Usage

When the TRANSCLUDE plugin, placed in Page A, fetches the wiki page B, the tag `%%text%%` on Page B is replaced by whatever is inside the TRANSCLUDE tag on Page A.

Furthermore, any other parameters (if they exist in Page B) will be replaced by their values given in the Transclude plugin on Page A..

Examples

```
{TRANSCLUDE(page="pageName" key="value" key="value" ...)}text{TRANSCLUDE}
```

For instance, say we have a todo box page with template like this:

```
{BOX(class="todo_box", float="right", title="__Todo__ on this page:")}  
%%text%%{BOX}
```

It will render like this:

Todo on this page:

text

Now, let's use that template page to 'transclude' some todo items on a page:

```
{TRANSCLUDE(page="todoBox")}  
* Bring out the garbage
```

```
* Feed the goldfish
{TRANSCLUDE}
```

All additional parameters will be replaced. For example `%%%title%%%` will be replaced with the parameter title in the plugin.

```
{TRANSCLUDE(page="todoBox" title="ToDo")}
* Bring out the garbage
* Feed the goldfish
{TRANSCLUDE}
```

Issues

`%%%title%%%` syntax conflicts with the `%%%` syntax for rendering a line break `
`
