

## RPM Install

This is an [installation](#) guide.

You can find all available Tiki releases from the [Download](#) page if you do not find your version here.

### Mandriva

Browse the Mandriva RPM repository to find your Tiki version.

[Tiki RPM](#)

[Mapserver-php RPM](#) for TikiMap

[tikiwiki-mapdata RPM](#) for TikiMap

After the installation of the RPM, point your browser to

```
http://127.0.0.1/tikiwiki-<version>/tiki-install.php
```

to complete the installation. Read InstallTikiDoc from create a MySQL database.

You may want to create a symlink from tiki to tikiwiki-<version>:

```
ln -s tikiwiki-<version> tiki
```

### RedHat

#### Fedora

##### Fedora Core 3

The tricky part, is to install the MySQL 4.1.

First, we start from a clean Fedora installation (with http server, and without Mysql). Update the system with up2date:

```
[root@fedoraC3 ~] up2date -uv
```

?Question: that can't be all? 1. where can I download the rpm for fedora from? Could someone link that here perhaps?
