

# Theme customizer

In [Tiki18](#), it was called "Style Guide Tool", but was renamed to "Theme customizer" in [Tiki19](#) to be more descriptive. There were also some changes as:

- Tiki18 uses Bootstrap 3 with Less
- Tiki19 uses Bootstrap 4 with Sass

New in [Tiki18](#), the Theme Customizer is an interactive page for editing site colors, fonts, and other style details, with the results shown in real time. The generated code can be input as custom CSS on the Look and Feel admin page, to modify the appearance of the Tiki site. This tool is for making overall, global changes.

The screenshot shows the 'Theme Customizer' interface. At the top, it says 'Theme Customizer' in blue. Below that is a 'Colors' section. There are five color swatches with their corresponding hex codes: Header (#343a40), Body (ffffff), Footer (ffffff), Text (#212529), and Links (#0004ff). Below the swatches is a 'Sample Text' area with a paragraph of placeholder text. At the bottom, there is a 'Generate Custom CSS' button, a checkbox for 'Keep changes after refresh', and a 'Select a section:' dropdown menu.

## Theme Customizer Overview

## How to activate it

To access the tool, go to the Look and Feel admin page ([tiki-admin.php?page=look](#)), and the "Customization" tab. The activation checkbox is near the bottom of the page. If you don't see it, the reason is probably that Advanced features aren't being displayed, so follow the instructions in the box below.

Activate the feature by checking the checkbox and clicking the "Apply" button. When the page refreshes, hover over the Theme Customizer "Actions" icon and, in the popup, click " View". This opens the Theme Customizer page.

Theme Customizer Checkbox

## How to use it

The tool works with the theme that is currently active at the site. Shown here are the Slate and TheNews themes.

### Tables

Striped table

Version	Star	Year
12.x	Altair	2013
13.x	Fomalhaut	2014
14.x	Peony	2015
15.x	Situla	2016
16.x	Tabby's	2016
17.x	Zeta Boötis	2017

There are sections of the tool for these page elements: page colors, fonts, headings, tables, buttons, forms, lists, navbar, dropdowns, tabs, alerts, and icons. At the page bottom there is a "Select a section" link for

navigating to the sections in the page.

Section selection

Colors can be selected by clicking in the square sample area for each item, which causes a colorpicker to display. Or the CSS hex value can be edited directly.

## Headings

### h1. Bootstrap heading

Font size:

Font weight:

Colorpicker

Changes such as font size and style affect the those properties on the HTML body tag, meaning that the changes will be implemented throughout the site unless they are overridden by a more-specific CSS rule for a particular page element.

## How to use the results - as CSS

After making the desired edits, to save the results as CSS code, click the "Generate Custom CSS" button.

```
/*
=====
Theme Customizer Generated CSS
=====
*/
a {
  color: #0004ff;
}
.h6 {
  font-size: 16px;
  font-weight: 500;
  letter-spacing: 55;
  color: #212529;
  text-transform: none;
}
```

Generate Custom CSS  Keep changes after refresh

Select a section:

## Custom CSS

To use the new custom CSS, copy it from the text area and paste it into the Custom CSS text area on the Look and Feel admin page. Generating custom CSS with this tool actually produces the CSS for all the items on the Theme Customizer page, not just for the edited/changed items. To reduce the amount of redundant CSS rules, the custom CSS could be edited to retain just the changed rules, and the other, unchanged rules could be removed (if you are familiar enough with editing CSS). [This redundancy should be improved in future development.]

As Look and Feel custom CSS, these style rules will of course affect any theme that is in effect at the site, and could have unwanted effects if a theme is selected for use other than the theme whose rules were customized with the Style Guide tool. This is something to consider if more than one theme is used at the site, such as if users have permission to select a theme for their personal use.

(More information on using custom Less variables is coming soon.)
