

Wysiwyg Editor User

If the site administrator has selected the Wysiwig editor as the default at ([Wysiwig Editor Admin](#)), the edit page will look like this:

The screenshot shows the 'Edit: New page' interface. At the top, it says 'Perhaps you are looking for: **HomePage**'. Below this is a tab labeled 'Use normal editor'. The form includes fields for 'Categorize' (with a 'show categories' link), 'Apply template:' (with a 'none' dropdown), and 'Description:'. A rich text editor toolbar is visible below these fields, containing various icons for text formatting (bold, italic, underline, etc.), alignment, and insertion. At the bottom of the toolbar are dropdowns for 'Style', 'Font', and 'Size', along with a 'Source' button.

If not enabled by default, the edit page would show a tab saying "**Use wysiwyg editor**", which would shift the editor from the classical (below) to the visual one (see previous image).

The screenshot shows the 'Edit: New page' interface in classical mode. It has the same header as the previous image. Below the header is a tab labeled 'Use wysiwyg editor'. The form includes fields for 'Categorize' (with a 'show categories' link), 'Apply template:' (with a 'none' dropdown), and 'Description:'. Below these fields is a large text area labeled 'Edit:'. At the bottom of the form, there is a 'Quicktags' section with a plus icon and three dots.

Shifting from visual editor to viewing html source code

Once using the wysiwyg editor, you can shift from the visual editor to the html source code, for instance, using the corresponding "**source**" button.

Edit: New page

Perhaps you are looking for:
HomePage

Use normal editor

Categorize show categories

Apply template: none ▾

Description:

Tiki6: source shown only if the permission is granted

The wiki page edit toolbar in Wysiwyg mode since Tiki6 is now checking if the user has the permission to use HTML (tiki_p_use_HTML), in order to show the "source" button. Similarly, the permission tiki_p_wiki_view_source will be required to allow converting that html into wiki syntax.

Pasting from word processor documents

There is a special feature (and button) to paste content from a word processor program (), which opens a pop up box with a visual text area. Use this to paste the content from your favourite editing program (such as OpenOffice.org Writer, KWord, ... or whatever other closed source alternatives):

Inserting or editing internal Wiki links

Pressing on the button "Inserting or editing internal Wiki links" (), will open pop up window that will allow you to create links to current wiki pages in the Tiki site.

The dialog box is titled "Tiki Link - Insert internal link". It contains a search section with the text "Select a Wiki page to link to:" followed by a "Find" label, a text input field, and a "find" button. Below this is a list of search results, currently showing "HomePage" with a "[prev]" button on the left and a "[next]" button on the right. At the bottom of the dialog are "OK" and "Cancel" buttons.

Inserting Tiki images

Pressing on the button "Tiki image" (), will open a pop up window that will allow you to insert images into the page.

The dialog box is titled "undefined". It has four tabs: "Image Info" (selected), "Link", "Upload", and "Advanced". Under the "Image Info" tab, there is a "URL" field with a "Browse Server" button next to it, and an "Alternative Text" field. Below these are fields for "Width", "Height", "Border", "HSpace", "VSpace", and an "Align" dropdown menu. To the right of these fields is a "Preview" window showing a block of Lorem Ipsum text. At the bottom are "OK" and "Cancel" buttons.

If you click in the "**Browse server**" button, you'll be able to select images from the tiki site to be inserted in that wiki page.
