

Plugin Redirect

Introduced in [Tiki3](#)

Use this [wiki plugin](#) to semi-permanently redirect any existing wiki page to any other specified wiki page or URL. If it's for wiki pages, a better alternative is the [Page Alias](#)

Parameters

Plugin Manager error: redirect plugin not found

Note:

- It does not check permissions of the destination page, so users may need to login after redirect.
- It can redirect to a wiki page or to any URL, which is why there is [Plugin security](#)
- There is no warning about "you will be redirected in 5 seconds message" or similar; it's instant!
- There is a check to stop possible loops
- URL redirects can be both: absolute starting with protocol like http:// or relative to the Tiki root

How to edit the redirect page?

Q:How do you go back to original page for editing...

A: Use `/tiki-editpage.php?page=TheTargetPageWithTheRedirectPlugin`

You can also go to the page history to view source, compare or unroll changes made that include the REDIRECT code. Use `/tiki-pagehistory.php?page=TheTargetPageWithTheRedirectPlugin`

Examples

The redirect plugin usage is:

```
{redirect page="pagename"}
```

or for URLs (tiki-something.php... or [http://...](#))

```
{redirect url="url"}
```

or for perspectives:

```
{redirect perspective="Id"}
```
