설정	설명	Default
전역 구성		
고급 등급	내부 등급 시스템을 활성화함, 이는 트래커, 기사 혹은 기타 기능에서의 값들을 계산하는데 사용됨.	
등급 재계산 모드:	등급 합계가 언제 그리고 어떻게 재계산되는지를 결정: * 투표시 (기본값): 투표가 수행될 때 매번마다 개체에 대한 점수가 재계산되어야함을 지정. 이 선택사항은 규모가 더 적은 사이트 및 등급이 사용될 때 비교적 단순한 연산 방식에 적절함. *로드시 무작위: 이는 무작위 기반으로 페이지 로드시에 일부 소수의 점수들이 계산되도록 will cause a few scores to be calculates on page load on a random basis (odds and count can be configured to adapt to site load). This option is suitable for calculation rules involving time that must be recalculated even if no new votes occurred. * Random on vote is similar to random on load, but will recalculate multiple scores (not necessarily including the current object) when a vote is performed. It is suitable for similar situations. The best option will depend on site load. * Periodic: is the best option for heavy load sites, making sure all calculations are done outside the web requests. A cron job must be set-up manually by the site's administrator. A sample script is available at the end of this page. Depending on the site load, some options may be better than others; on large volume sites, we recommend cron job. The Recalculate on vote recalculation may be inaccurate if rating calculation depends time. Before any attempt to re-index the object: Ties into the Search and List from Unified Index and updates the calculation at index-time.	Recalculate on vote
Recalculation odds (1 in X):		
Recalculation count:

Articles	Enable a simple rating bar at the top of each articles page.	
Jser ratings on articles		

설정 설명 Default

Article rating options:

ne feature must first be enabled through this same administration panel. Along with the feature, a few options are available. Among them, the score ecalculation period must be defined. These are the available options:

- On vote (default) indicates that the score for the object should be recalculated every time a vote is performed. This option is suitable for sites with lower volumes and relatively simple calculation methods when ratings are used.
- **Random on load** will cause a few scores to be calculates on page load on a random basis (odds and count can be configured to adapt to site load). This option is suitable for calculation rules involving time that must be recalculated even if no new votes occurred.
- **Random on vote** is similar to random on load, but will recalculate multiple scores (not necessarily including the current object) when a vote is performed. It is suitable for similar situations. The best option will depend on site load.
- **Periodic** is the best option for heavy load sites, making sure all calculations are done outside the web requests. A cron job must be set-up manually by the site's administrator. A sample script is available at the end of this page.

or the random options, the odds of recalculating must be specified as a dice roll. For each occurrence of a recalculation, a limit to how many scores can e calculated must be specified to avoid the hang-up effect on the page load.

ne value ranges for each object type can also be specified through the administration panels.

ne common *sort_mode* parameter to lists can be used to activate sorting using advanced ratings. To do so, the sort mode must be set to dv_rating_X_asc or adv_rating_X_desc where X is the ID of the rating configuration. The default sort can also be set to advanced ratings in the dministration panel where applicable.

Calculation configuration

om the administration panel, new calculations can be added. Initially, only the name is required. When created, the calculation will contain suitable efault values.

or wiki pages:]

nus, visitors can provide feedback like:

- Did this page help you solve the issue?
- Was this page easy to understand?

Advanced Rating

troduced in Tiki5, the advanced rating feature allows for more control over the aggregation of scores.

ating methods are defined globally and will be used for all supported objects. They are defined through the **Advanced Rating** administration panel (tiki dmin.php?page=rating). Multiple methods can be created. If a method contains type-specific calculations, it will be ignored when performing the alculation.

eatures currently supporting sorting through advanced rating:

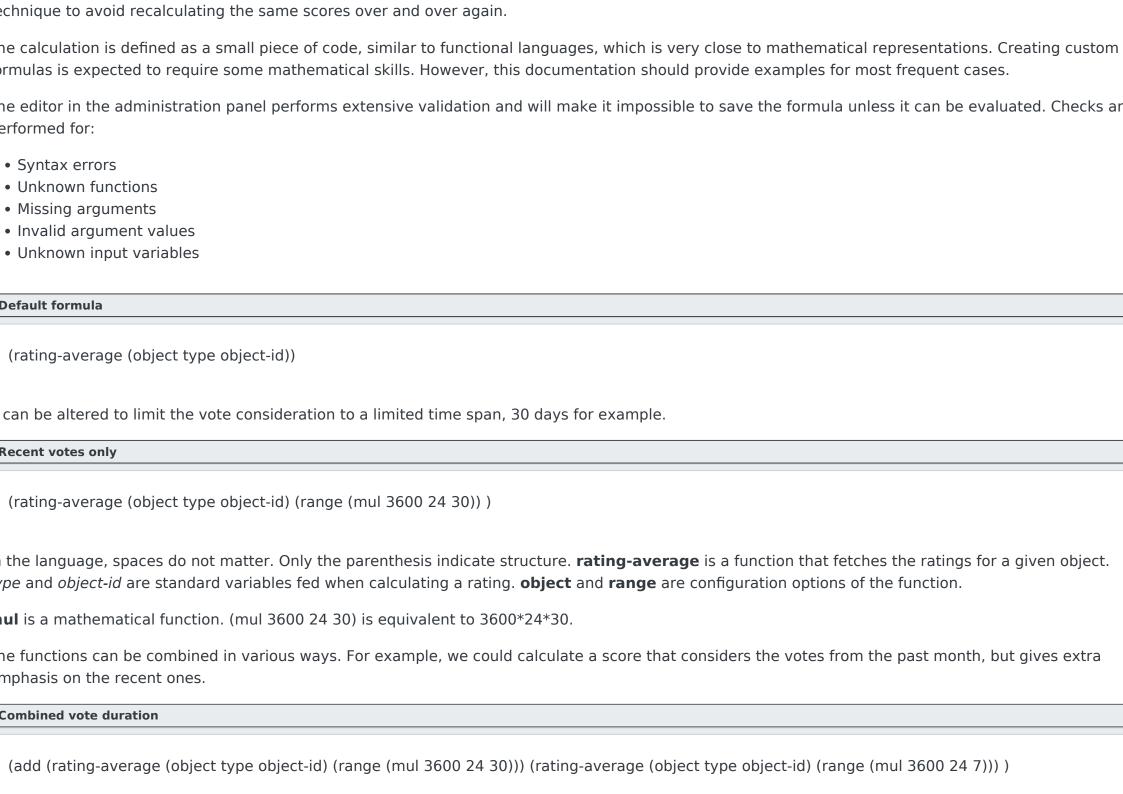

- Articles
- Wiki
- Comments

Sorting items according to advanced rating

ote that the sort mode to use when needing to sort by advanced rating is either adv_rating_xx_asc or adv_rating_xx_desc, where xx is the ratingConfiglo

Set-up

y default, each calculated value is kept for 1 hour (3600 seconds). This limit does not apply when recalculating on vote, but is used for every other

ven though the votes are 1-5, the final score can be on an entirely different scale. The language is also extensible if the calculation needs to be combine ith other factors or weight. See Rating Language.

Il available options are documented in the following section.

General Reference comment

ny comment block is stripped from the formula at parse-time

Examples

(mul 1 2 (comment Simple enough?)) -> 2

nul (Multiply)

erforms a simple multiplication accepting multiple input values.

Examples

(mul 3 4) -> 12 (mul (mul 3 4) 5) -> 60 (mul 3 4 5) -> 60 (mul 4 0.5) -> 2

div (Divide)

erforms a simple division accepting multiple input values.

Examples

(div 3 4) -> 0.75 (div (mul 3 10) 5) -> 6 (div 30 5 3) -> 2 (div 4 0.5) -> 8

add (Sum)

erforms a simple sum accepting multiple input

Examples

(add 3 4) -> 7 (add (add 3 4) 5) -> 12 (add 3 4 5) -> 12 (add 4 0.5) -> 4.5

sub (Substract)

erforms a simple substraction accepting multiple input

Examples

(sub 3 4) -> -1 (sub (sub 3 4) 5) -> -6 (sub 3 4 5) -> -12 (add 4 0.5) -> 3.5

ound

ounds to a specific number of digits (new in Tiki12)

Examples

(round 4.556234342234 2) -> 4.56 (round 4.556234342234) -> 5

coalesce

eturns the first non-empty value from the list.

Examples

(coalesce 3 4) -> -3 (coalesce (sub 3 3) 5) -> 5 (coalesce 0 0 (str) -10) -> -10 (coalesce 0 0 0 0 0) -> 0

str

enerates a static string when needed and the processor attempts to process the string as a variable. Any arguments will be concatenated using spaces.

ote: The quoted string syntax was included in Tiki13.

Examples

(str hello-world) -> "hello-world" (str hello world) -> "hello world" (str hello world foobar) -> "hello world foobar" (str (mul 2 3) "= 6") -> "6 = 6"

concat

oncatenates a string of text. (new in Tiki12)

ote: The quoted string syntax was included in Tiki13.

Examples

(concat (str \$) 1234) -> "\$1234" (concat 14 (str %)) -> "14%" (concat 14 "%") -> "14%"

nap

enerates a map (or dictionary).

Examples

(map (key1 1) (key2 2) (key3 (str value3))) -> {"key1": 1, "key2": 2, "key3": "value3"}

equals

ompares multiple values.

Examples

(equals 2 (add 1 1) (sub 4 2)) -> 1 (equivalent of 2 == 1+1 && 2 == 4-2) (equals (add 1 1) 3) -> 0

f

onditionally evaluates a branch.

Examples

(if (equals 2 2) 42 -1) -> 42 (if (equals 2 1) 42 -1) -> -1

and

nsures all elements evaluate to true.

Examples

(and 3 2 1 2 3) -> 1 (and 2 3 0 2) -> 0

r

nsures that at least one element evaluates to true. Elements are evauated sequentially until a false element is found. Others are left unevaluated.

Examples

(or 3 2 1 2 3) -> 1 (or 2 3 0 2) -> 1 (or 0 0) -> 0

nash

enerates a hash based on multiple values. Used primarily to generate aggregate hashes in the PluginActivityStream. Note that because it is a hash, the xact value coming out does not matter. Only that given the same parameter, it will produce the same value.

Examples

 $(hash 1) \rightarrow [sha1("1")] (hash 1 2 3 4) \rightarrow [sha1("1/2/3/4")] (hash 1 2 (map (a 3) (b 4))) \rightarrow [sha1("1/2/3/4")]$

avg

alculates the average of multiple values. All entries in the list will be flattened if arrays are present.

Examples

(avg 1 2 3) -> 2 ... given list contains [1, 2, 3] (avg list) -> 2

split-list

oduces a multi-dimensional array out of a text string. Each line is expected to be an independent value, each line will be split by a separator into the pecified keys.

Examples

... given str contains a list of 3 comma-separated values (split-list (content str) (separator ,) (keys a b c)) -> [{a: 1, b: 2, c: 3}, {a: 2, b: 3, c: 4}]

or-each

or a list of value pairs, such as the output of split-list, evaluates a formula for each set of values, returns the list of results.

ithin the formula, variables coming from the list will be used first. Fallback will be on the other variables available in the execution context.

Examples

... given items contains [{a: 1, b: 2, c: 3}, {a: 2, b: 3, c: 4}] (for-each (list items) (formula (mul a b c))) -> [6, 24] ... given items contains [{a: 1, b: 2, c: 3}, {a: 2, b: 3, c: 4}] ... and d contains 10 (for-each (list items) (formula (mul c d))) -> [30, 40]

고급 등급-특정 참조

ating-average (등급-평균) 및 rating-sum (등급 합계)

·급 함수는 등급 기록 테이블에서 점수를 계산합니다. 사이트에 수행된 각 등급은 데이터베이스 내에 보관되며 사용자 지정 등급을 계산하기 위해서 사용될 수 있습니다. 다양한 선 사항이 문서의 품질 향상을 지원하거나 피드 수집기로 들어오는 데이터의 순위를 매기기 위하는 등의 사이트 상의 중요성을 반영하기 위하여 점수를 계산하도록 적용됩니다.

- **object (개체)**, 필수이며 항상 이 내용상 *(개체 유형 개체ID)*.
- range (범위), to limit how long votes are considered. Argument is provided as a number of seconds.
- ignore (무시), with anonymous as an argument to only consider votes from registered users.
- **keep** (유지), to only consider one vote per visitor. Unless the option is present, all of the votes are taken into account. The option can be either *latest* or *oldest* to indicate which one to keep.
- **revote** (邓투표) can be specified if **keep** is specified. Indicates the time period required between votes. For example, users could be allowed to vote more than once per day, but only their latest vote each day would be considered, if revote is set to mul(24 3600). If the user voted yesterday as well as today, both votes will be counted.

article-info

산에 포함될 수 있도록 기사에서 정보를 추출. 첫 번째 인자는 언제나 항상 'article' (기사)가 되어야함 . 그 외 다른 값이 되는 경우, 연산은 평가된 개체에 대하여 건너뛰어지게 되 , 이를 공식 유형-특화시켜 버립니다.

용가능한 속성들:

- rating (등급), 기사에 첨부된 정적 등급
- view-count
- age-second
- age-hour
- age-flourage-day
-
- age-weekage-month

예제

(article-info type object-id rating) (article-info (str article) 42 age-month)

속성

통의 개체 속성에서 정보를 추출함.

예제

(attribute (object type object-id) (property tiki.proposal.accept)) -> [value for page in a rating calculation] (attribute (object (str wiki page) 14) (property tiki.proposal.accept) (default 0)) -> [value for page id 14]

racker-field

래커 항목에서 정보를 추출함. 필드 값은 숫자로 자동으로 변환됨. 값이 발견되지 않거나 적용 불가능 한 경우 0 이 제공됨.

예제

(tracker-field (object type object-id) (field priority)) -> [value contained in the tracker item field with permanent name "priority"]

category-present

체상에 존재하는 모든 나열된 범주의 점수에 1을 부여함.

예제

(category-present (object type object-id) (list 3 4)) -> [0, 1 or 2 - Depending on how many of categories 3 or 4 are on the object]
