An example slideshow for Tiki

Wiki pages can be rendered in slideshow mode

Introduction

This is a very simple example of how wiki content can have alternate outputs.
The concept was first based on S5, a early-day HTML slideshow engine.
It is nowadays powered by reveal.js

Simple HTML (or wiki)

You then just make your slides like you would a wiki page. Each
(or the equivalent in wiki syntax or markdown) becomes a slide title and all the things under it are the slide body. The

(or !) is the title of the presentation and things below it are part of the footer.

The End

That's all folks!
