

# Funcionalidades

TikiWiki es un "sistema de gestión de contenido" (SGC o CMS, de sus siglas en inglés) lleno de funcionalidades — está tan repleto de funcionalidades que puede ser abrumador, incluso para un usuario experimentado o administrador. Por lo tanto, parece adecuado y útil dividir las funcionalidades de TikiWiki en estas categorías generales:

- **Herramientas del Sistema de Gestión de Contenidos** Estas características permiten a los administradores y usuarios crear, mostrar, y mantener contenido accesible por red de todo tipo, incluyendo texto, datos binarios, imágenes, enlaces, y mucho más.
- **Herramientas de organización del Contenido y Ayudas de Navegación** Estas funcionalidades permiten a las personas administradoras y usuarias organizar, estructurar, y presentar contenido de una forma navegable.
- **Herramientas de Comunicación** Estas funcionalidades permiten a las personas administradoras y usuarias comunicarse entre ellas (y con el mundo exterior) por medio de numerosos medios, incluyendo mensajería interna, telefonía de voz, intercambio de datos, y muchos más.
- **Herramientas de Administración** Estas funcionalidades permiten a personas administradora (y a personas usuarias a quien se les ha asignado los permisos apropiados) administrar todos los aspectos de un sitio basado en Tikiwiki.
