Geographic feature Tracker Field
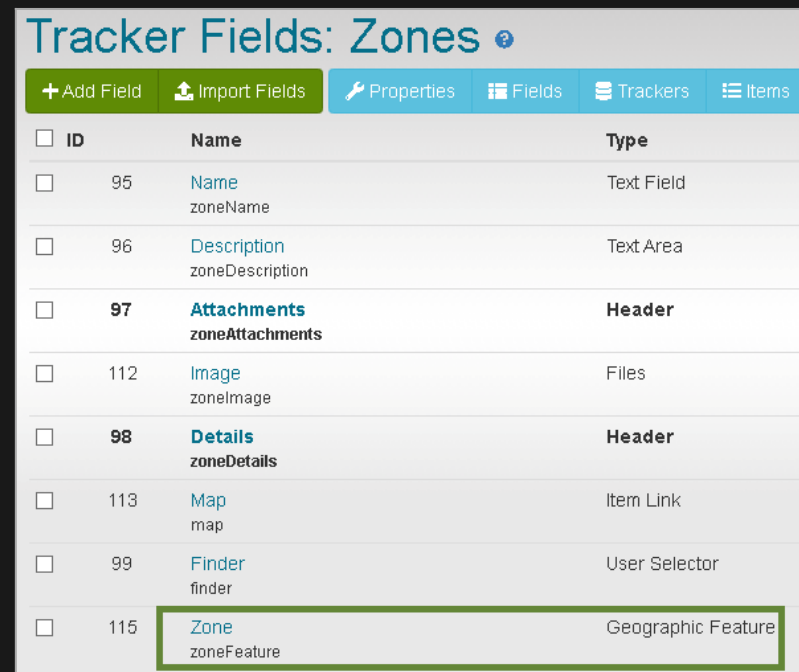

his field stores a geographic features on the map, allowing paths (linestring) and boundaries (polygon) to be drawn on the map an
to be saved.

To make this possible, you must export the profile **Cartograf**.
n one of the Trackers of the profile **Cartograf** in this case the Tracker **Zones** connected to the Tracker **Map** through the field **Map**
of the Item Link type, you can see the field **Zone** of the Geographic Feature type. It is through this field that you can, once the
profile has been exported, draw the paths and boundaries on a map that you would have created.
As you can see from the capture below, the Tracker **Zones** has a field of type **Geographic Feature** called **Zone**.

Click to expand

So, very simply you can customize your maps by adding paths and boundaries using the field type **Geographic Feature**.
