

# Google WebFont Fonts

It's quite easy to use Google Fonts in Tiki!

See also: PluginFont

## How to configure

The screenshot shows the Tiki theme configuration interface with the 'Customization' tab selected. The 'Theme Generator (Experimental)' section is disabled. The 'Custom Codes' section contains a 'Custom CSS' field with the following code: `html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }`. Below this is a 'Change Highlighter' button and an 'Experimental: CSS assistant (work in progress - click the x to remove)' notification. The 'Custom HTML <head> Content' field contains the following code: `<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>`

**To affect most of the text**

`html > body, *:first-child + html body`
