

# Google Website Translator

This is one of many Interoperability options.

This is similar but different than the Google Translate integration (which is a paid service)

See:

- <https://translate.google.com/manager/website/>
- <https://support.google.com/translate/>

You need to put two snippets of code in your site.

1- To prove that you control this site, add the meta google-translate-customization code (provided by Google) to tiki-admin.php?page=look -> Customization -> Custom HTML

Content

2- Since this will ask that you put some HTML/JavaScript on your site, you should use PluginHTML and makes sure to check "Must be wiki parsed" if you put in a Module.

You need to tweak the code from Google slightly as explained here:

<http://thread.gmane.org/gmane.comp.cms.tiki.devel/28553/focus=28559>

**Use PluginHTML like this**

```
{HTML()}
```

```
{HTML}
```
