# Graphviz Install

Graphviz provides a collection of tools for manipulating graph structures and generating graph layouts. For those who would like to use **Dynamic SiteMap** graph generation in Tikiwiki, we recommend the Graphviz library and the PluginWikigraph. GraphViz with Wikigraph plugin (in mods.tw.o) work well still with Tiki 3 LTS, but not with Tiki 6 LTS.

# Install Graphviz and Libs

- On Windows the default installer exe should do all necessary steps. Get Graphviz from http://graphviz.org/pub/graphviz/.
- On RPM based system (RedHat, Mandrake) rpm -q graphviz
- On APT based system (Debian, Knoppix) apt-get -s install graphviz
- For Portage users (Gentoo) emerge graphviz

## Testing an installed Graphviz Setup

• ♪ Point your browser to http://127.0.0.1/tiki-wiki\_graph.php?page=HomePage&level=2

# **Troubleshooting Hints**

- A Graphviz consumes LOTS of memory with even small (no. of wikipages less than 100) wiki content. Try to keep the *Level* of the graph low in order to use wiki pages including dynamic graphs.
- Alf you use Windows, copy GraphViz binary files (dot.exe, neato.exe, etc) from the GraphViz bin folder to the windows\system32 or equivalent folder (NaV/system32). The installer should have done this job for you, but we recommend double-checking if you encounter errors. It's not the same to put the exe's in the path, they must be in a Windows system directory.
- In PHP Safemode environments, special adjustments need to be made to use external libraries.
  - These settings will be included here.

#### From Here

 $\cdot$   $\blacksquare$  Take a look at how to use the PluginWikigraph.
