Plugin Cypht

This permits to *plug* the Cypht webmail client in a wiki page.

HISTORY AND STATUS

Tiki and Cypht webmail interoperability started with Tiki20 (2019). Tiki had a webmail since the early days but it was buggy, lacked features and was not improving. Since it would require too much work (and some specific expertise about email protocols) to get it up to modern standards, it was determined a better strategy to integrate an existing project (despite tradeoffs like feature overlap, integration challenges, etc.). See also: Why did Tiki pick Cypht? Major work has been done since that time in Cypht, and in Tiki 21, 22, 23, 24, 25 and 26. Work is ongoing, so it's recommended to run the latest 27.x from Git or Daily Build. Most enhancements and many fixes will not be backported as there are lots of changes. Please see this known issue. In June 2023, Cypht became a community project and Jason (the original author) is no longer the most active contributor. Jason is now more in an advisor mode, and the activity level has grown quite bit with the influx of Tiki developers.

SYNTAX

{cypht}

PARAMETERS

Embed Cypht webmail and news reader.
Introduced in Tiki 20.0.
Go to the source code

Parameters

group

imap_name

imap_password

imap_port

imap_server

imap_username

smtp_name

smtp_password

Accepted Values

any string except for HTML and PHP tags

text

password

text

text

`use_global_settings`

(blank)

n

nw

y

Use global Cypht settings available at Tiki Webmail page. Choosing "No" will make this instance of Cypht use its own settings. Useful if this is a Groupmail box or you don't want to mix mailbox server and/or site settings from other pages. There are two modes of non-global settings - default one stores settings per user where each individual Tiki user will have their own copy of the settings whereas the second one stores settings per wiki page. Use per-wiki-page option if you want the plugin Cypht settings shared between users using the plugin on the same wiki page.
