Plugin Get AccessÂ Token

Starting with Tiki7, this wiki plugin, which requires admin validation, is designed for an admin to display a link on a secure page to another page using a security access token. This might be useful where on one page which is accessible to users through a token the user needs to be able to access another secondary page using a different token.

Parameters

Display a link on a secure page using an access token
Introduced in Tiki 7. Required parameters are in `bold`.
Go to the source code
Preferences required: auth_token_access, wikiplugin_getaccesstoken

Parameters	Accepted Values
`entry`	text
`values`	text *separator:* `:`

Description

The path or part of the path that the token is for

Query string parameter values that the token is for,
separated by a colon (:)

Default	Since
	7.0
	7.0

`keys` text

separator: `:`

Query string parameter keys that the token is for, separated by a colon (:)

Example

Basic syntax

{getaccesstokem entry="tiki-payment.php" keys="invoice" values="23"}

Tracker example

Imagine that you have a survey created on a tracker split in many different wiki pages (using PluginTracker in them).

You need to have an autoincrement field of type `itemId`, and if you can find a way to make the multiple tokens easily, then you can use this plugin this way:

{tracker trackerId="" fields="1:2" action="Save and Next" url="tiki-index_raw.php?page=next&TOKEN={getaccesstoken entry="tiki-index_raw.php" keys="page:itemId" values="next:{$f_1}"}"}

Where `{$f_1}` is that autoincrement `itemId` field above.
