

Spellchecking

Tiki contains an optional spellchecking ability that uses its own dictionary. When entering wiki text in specific features

Tiki can automatically identify misspelled words and offer suggestions.

The language-specific dictionary used by the spellchecker is an additional database table that can be downloaded from

Sourceforge and added to your database.

Spellcheck FAQs

Q: Why does spellcheck flag all capitalized words as incorrect?

A: Because it has been broken for a *long* time. See this post from 2007.
