PHP
# To be able to use the functionality of a module which is not built into the server,
# you have to place corresponding 'LoadModule' lines at this location so the
# dynamic shared object (DSO) will be loaded with the module. The line should
# look like the following:
# LoadModule module_name /usr/lib/apache2/modules/module_name
# The module name is a combination of the module name and the architecture
# where the module is located. For example, on a 32bit system you might have a
# module named mod_ssl.so located in /usr/lib/apache2/modules. In this
# case the line would look like:
# LoadModule ssl_module /usr/lib/apache2/modules/mod_ssl.so
