Encoding Fix Verification
Because changes to your Tiki database encoding can be confusing and difficult to troubleshoot problems it's best to do a few quick verification, after you have applied the three steps of the upgrade process to "fix the encoding issue" (if needed, see <a href="https://doc.tiki.org/Upgrade#Fix_the_encoding_issue">https://doc.tiki.org/Upgrade#Fix_the_encoding_issue</a> ).
1.1. Verify local.php
This file stores the Tiki database connection information
<ol> <li>Open /db/local.php with your favorite text editor (vi, emacs, etc)</li> <li>Verify client_charset is set to utf8</li> <li>update manually if incorrect</li> </ol>
1.2. Verify Database
The database and its tables should have been updated to use the utf8 character set. Verifying the database involves querying the "information_schema" which is essentially the data dictionary for MySQL. So log in to MySQL using the Tiki schema (database) owner account to execute these queries.

# 1.2.1. Schema verification

This simple select lists characteristics for the database itself.

#### Schema Verification SQL

select \* from information\_schema.schemata;

- 1. Run the SQL
- 2. Verify the "DEFAULT\_CHARACTER\_SET\_NAME" for the Tiki schema is set to "utf8" and that "DEFAULT\_COLLATION\_NAME" is set to "utf8\_general\_ci"
- 3. If these values are not as specified, run the below SQL:

#### Schema Correction SQL

ALTER DATABASE {Tiki db name} DEFAULT CHARACTER SET 'utf8' DEFAULT COLLATE 'utf8 general ci';

# 1.2.2. Table verification

This simple select lists key characteristics for each table of the Tiki DB.

### **Table Verification SQL**

select table\_name, table\_collation from information\_schema.tables where table\_schema = '{Tiki db\_name}';

- 1. Run the SQL
- 2. Verify "table collation" is set to "utf general ci"
- 3. Run the below SQL for each table not set correctly

### **Table Correction SQL**

ALTER TABLE {Tiki db\_name}.{Table Name} CONVERT TO CHARACTER SET 'utf8' COLLATE 'utf8\_general\_ci' DEFAULT CHARACTER SET 'utf8' COLLATE 'utf8\_general\_ci';

# 1.2.3. Content verification

You need to be sure that the content in your database has been converted to utf-8. If you had non as-cii characters in your wiki pages, it's very easy to verify if you had your db tables content converted to utf-8 or not.

If you see weird characters instead of non-ascii characters like accents, tilde, apostrophes, etc, then your content is not in utf-8. In this case, you can apply the fix from the installer in the last step.

 $Check\ https://doc.tiki.org/Upgrade\#Fix\_the\_encoding\_issue\ .$ 

If you were using plain English in your wiki pages, then ask for help in the Irc channel, for instance.
