

# Geographic feature Tracker Field

This field stores a geographic features on the map, allowing paths (linestring) and boundaries (polygon) to be drawn on the map and to be saved.

To make this possible, you must export the profile [Cartograf](#).

In one of the Trackers of the profile **Cartograf** in this case the Tracker **Zones** connected to the Tracker **Map** through the field **Map** of the Item Link type, you can see the field **Zone** of the Geographic Feature type. It is through this field that you can, once the profile has been exported, draw the paths and boundaries on a map that you would have created.

As you can see from the capture below, the Tracker **Zones** has a field of type **Geographic Feature** called **Zone**.

ID	Name	Type
95	Name zoneName	Text Field
96	Description zoneDescription	Text Area
97	Attachments zoneAttachments	Header
112	Image zoneImage	Files
98	Details zoneDetails	Header
113	Map map	Item Link
99	Finder finder	User Selector
115	Zone zoneFeature	Geographic Feature

Click to expand

So, very simply you can customize your maps by adding paths and boundaries using the field type **Geographic Feature**.
