

# Google Web Fonts

It's quite easy to use [Google Fonts](#) in Tiki!

See also: [PluginFont](#)

## How to configure

The screenshot shows the 'Theme' tab selected in the top navigation bar. Below it, there's a section titled 'Theme Generator (Experimental)' with a checkbox labeled 'Theme Generator'. To the right of the checkbox are two small icons: a blue question mark and a yellow warning triangle. Underneath this is a 'Custom Codes' section with a 'Custom CSS:' label and a code editor containing the following CSS:

```
html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }
```

Below the code editor is a 'Change Highlighter' button. At the bottom of the section, there's a note: 'Experimental: CSS assistant (work in progress - click the x to remove)'. Further down, under 'Custom HTML <head> Content', there's a code editor containing the following HTML:

```
<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>
```

### To affect most of the text

html > body, \*:first-child + html body
