Paramètres

Display the time until or after a date and time

Introduced in Tiki 1. Required parameters are in **bold**.

[Go to the source code](#)

Preferences required: wikiplugin_countdown

Parameters	Accepted Values	Description	Default	Since
	(body of plugin)	Text to append to the countdown.		
enddate	datetime	Target date and time. Multiple formats accepted.	1	
caldays	(blank) y n	Will use calendar day difference when set to Yes (y) and time units are not shown. Result is that tomorrow, for example, is always shown as a one day away even if less than 24 hours from now. No (n) is the default.	n	9.0
since	(blank) y n	If Yes (y), will display amount of time since the event (default). If No (n) and if there is body text, will display "is over" or custom text set in text parameter after body text.		4.2
show	(blank) y yo yod yodh yodhm yodhms o od odh odhm odhms d dh dhm dhms h hm hms m ms s	Select: y=years, o=months, d=days, h=hours, m=minutes, s=seconds. Enter multiple values as: yodhms. Must be in the order of descending length, and a time unit should not be skipped. If blank, the time is shown down to the hour if not zero.		4.2

<code>text</code>	Text that will show with the countdown and body text. Set to <code>default</code> or leave empty to show "xxx days until/since <code>body text</code> ", except that if the <code>since</code> parameter is set to No (<code>n</code>), " <code>body text</code> is over" will show after the end date has passed. Also, if no time is shown because of the time units being displayed (for example, only years are shown and it's less than a year before/after the end date) then " <code>body text</code> will happen in less than a year/happened in the last year" will show. Or set pipe-separated custom text as follows: <code>before date before date by less than shortest time unit shown after date after date by less than shortest time unit shown after date and since set to No (n)</code> . Set to <code>silent</code> for no text.	9.0	
<code>thousands</code>	(blank) c p s	Set the thousands separator for results of 1,000 or more. Choices are comma (<code>c</code>), decimal (<code>d</code>), space (<code>s</code>), or leave blank for no separator.	9.0

Exemples

1. Ce code, → Produira :
`{COUNTDOWN(enddate="01-Apr-2020")}` le
 projet est terminé !
`{COUNTDOWN}` → le projet est terminé !
2. Ce code, → Produira :
`{COUNTDOWN(enddate="2020-03-05T22:00"`
`show="m")}` le projet est
 terminé ! → le projet est terminé !
`{COUNTDOWN}` → le projet est terminé !
3. Ce code, → Produira :
`{COUNTDOWN(enddate="01-Apr-2020"`
`caldays="y" show="yod")}` le projet est
 terminé ! → le projet est terminé !
`{COUNTDOWN}` → le projet est terminé !
4. Ce code, → Produira :
`{COUNTDOWN(enddate="01-Apr-2010"`
`since="n" text="before|is happening in less`
`than a month|after|happened way less than a`
`month ago|has passed")}` la date de
 mariage du projet → la date de mariage du
`{COUNTDOWN}` → mariage du projet

5. Ce code,
{COUNTDOWN(enddate="01-Apr-2010"
since="y" show="yodhms")}_ la date de
mâriage du projet
{COUNTDOWN}

→ Produira :
14 years, 6 months, 1 day, 12 hours, 15 minutes
and 44 seconds since **la date de**
mâriage du projet

Si vous souhaitez rafraîchir automatiquement la page toutes les 60 secondes, vous pouvez utiliser ce code :

```
{HTML()}<meta http-equiv="refresh" content="60">{HTML}
```

ou utiliser un module JavaScript ou jQuery pour rafraîchir automatiquement cette opération, ou peut-être faire un appel Ajax pour le module Si vous trouvez une meilleure méthode que celle décrite ci-dessus, n'hésitez pas à la documenter ici.
