

# Plugin A Name

This [wiki plugin](#), available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the [PluginAlink](#), which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the [PluginAlink](#) to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

# Usage

To take use this plugin in a wiki page, use the syntax:

```
{ANAME()}anchorname{ANAME}
```

In the generated XHTML for your webpage, Tiki will create the following anchor:

## Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores ( \_ ).  
For example, `{ANAME()}my custom anchor{ANAME}` will render as: .
- Starting with Tiki release 2, Tiki generates the anchor using the `id` attribute. In prior releases, Tiki used the HTML `name` attribute `()`.

Example

# Aname Plugin Usage

{ANAME() }

anchorname

{ANAME}

ANAME example: {ANAME() }anchorname{ANAME}

# Alink Plugin Usage

```
{ALINK(
```

```
aname=anchorname
```

```
)}
```

```
link text
```

```
{ALINK}
```

ALINK example: `{ALINK(aname=anchorname)}link text{ALINK}`

or rather, I only work so

ALINK example: `-+{ALINK( aname="anchorname" pagename="wiki pagename")}`link text`{ALINK}+`
