

## Plugin A Name

This [wiki plugin](#), available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the [PluginAlink](#), which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the [PluginAlink](#) to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

## Usage

To take use this plugin in a wiki page, use the syntax:

```
{ANAME()}anchorname{ANAME}
```

In the generated XHTML for your webpage, Tiki will create the following anchor:

### Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores ( \_ ). For example, `{ANAME()}my custom anchor{ANAME}` will render as: .
- Starting with Tiki release 2, Tiki generates the anchor using the `id` attribute. In prior releases, Tiki used the HTML `name` attribute `()`.

## Example

## Aname Plugin Usage

`{ANAME() }`

`anchorange`

`{ANAME}`

ANAME example: `{ANAME() }anchorange{ANAME}`

## Alink Plugin Usage

`{ALINK(`

`aname=anchorange`

`)}`

`link text`

`{ALINK}`

ALINK example: `{ALINK(aname=anchorange)}link text{ALINK}`

or rather, I only work so

ALINK example: `-+{ALINK( aname="anchorange" pagename="wiki pagename")}`link text{ALINK}+
