Plugin Get Access Token

Starting with Tiki7, this wiki plugin, which requires admin validation, is designed for an admin to display a link on a secure page to another page using a security access token. This might be useful where on one page which is accessible to users through a token the user needs to be able to access another secondary page using a different token.

Parameters

Display a link on a secure page using an access token
Introduced in Tiki 7. Required parameters are in `bold`.
Go to the source code
Preferences required: auth_token_access, wikiplugin_getaccesstoken

Parameters	Accepted Values	Description	Default	Since
`entry`	text	The path or part of the path that the token is for		7.0
`values`	text *separator:* `:`	Query string parameter values that the token is for, separated by a colon (:)		7.0
`keys`	text *separator:* `:`	Query string parameter keys that the token is for, separated by a colon (:)		7.0

Example

Basic syntax

```
{getaccesstokem entry="tiki-payment.php" keys="invoice" values="23"}
```

Tracker example

Imagine that you have a survey created on a tracker split in many different wiki pages (using PluginTracker in them).

You need to have an autoincrement field of type `itemId`, and if you can find a way to make the multiple tokens easily, then you can use this plugin this way:

```
{tracker trackerId="" fields="1:2" action="Save and Next" url="tiki-index_raw.php?page=next&TOKEN={getaccesstoken entry="tiki-index_raw.php" keys="page:itemId" values="next:{$f_1}"}"}
```

Where `{$f_1}` is that autoincrement `itemId` field above.
